2992	346.81709	9 323.1289	82.099	918			

Random Forest model most significant variable : Sunshine, MinTemp, Temp3pm, Temp9am, MaxTemp, Pressure9am, Pressure3pm

Overall most significant variable: Rainfall

Overall not significant variable: Evaporation, WindSpeed3pm, WindSpeed9am, Cloud3pm, WindDir9am, WindDir3pm, Location, RainToday

Hence the not significant variables above could be ommitted because they have very little effect on performance.

According to the model created in Question 4, i know that the most significant variable is Rainfall. Hence, we can use rainfall to make a prediction to predict is tomorrow raining or not.

If value of rainfall is larger than 0.05, tomorrow will not be raining, else it will be raining tomorrow.

Hide

head(humid.test[,c("Rainfall","MHT")],10)

	Rainfall <dbl></dbl>	
34	0.8	0
37	0.0	0
57	0.0	0
67	1.0	1

	Rainfall MHT <dbl> <fctr></fctr></dbl>	
76	0.0 0	
85	7.2 0	
100	0.0 0	
137	0.0 0	
164	0.0 0	
169	0.0 1	
1-10 of 10 rows		

So, by using this we found out that the accuracy of this model is 5/10 = 0.5

# **Decision Tree Pruning**

                                                                                            Hide
summary(prunedtree)
```

```
Classification tree:

tree(formula = MHT ~ ., data = humid.train)

Variables actually used in tree construction:

[1] "Rainfall"

Number of terminal nodes: 2

Residual mean deviance: 1.37 = 29160 / 21290

Misclassification error rate: 0.4432 = 9436 / 21289
```

```
plot(prunedtree)
text(prunedtree, pretty = 0)
```

```
| Rainfal | < 0.05
```

After pruning is the same model as the Decision Tree in Question 4, so the Decision Tree in Question 4 can be considered as a good tree already.

Hence its accuracy and Area Under Curve Values will be the same.

Important factors: Rainfall

Using attribute Rainfall giving us an accuracy of 0.564 is better than other attributes.

### Artificial neural network

```
humid.neural <- nnet(MHT~.-MHT, data = humid.train, size = 4, decay = 0.0001, maxit = 500)</pre>
```

```
# weights: 89

iter 110 value 14267.411362
final value 14266.968358
converged
```

#### Confusion Matrix of ANN:

Hide

```
humid1.neural.predict <- predict(humid.neural, humid.test, type = 'class')
confusionMatrix(as.factor(humid1.neural.predict), humid.test$MHT)</pre>
```

```
Confusion Matrix and Statistics
         Reference
Prediction
             0
        0 2618 1632
         1 2074 2801
              Accuracy : 0.5939
                95% CI: (0.5837, 0.604)
   No Information Rate: 0.5142
   P-Value [Acc > NIR] : < 2.2e-16
                 Kappa: 0.1893
Mcnemar's Test P-Value: 4.352e-13
           Sensitivity: 0.5580
           Specificity: 0.6319
         Pos Pred Value : 0.6160
         Neg Pred Value: 0.5746
            Prevalence: 0.5142
         Detection Rate: 0.2869
   Detection Prevalence: 0.4658
     Balanced Accuracy: 0.5949
       'Positive' Class: 0
```

#### AOC of ANN:

```
roc(humid.test$MHT,as.numeric(humid1.neural.predict))
```

```
Setting levels: control = 0, case = 1
Setting direction: controls < cases
```

#### Call:

```
roc.default(response = humid.test$MHT, predictor = as.numeric(humid1.neural.predict))
```

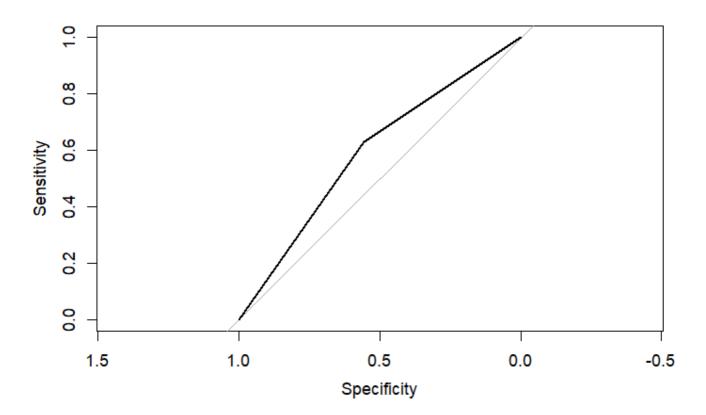

Data: as.numeric(humid1.neural.predict) in 4692 controls (humid.test\$MHT 0) < 4433 cases (hum id.test\$MHT 1).

Area under the curve: 0.5949

Hide

```
plot(roc(humid.test$MHT,as.numeric(humid1.neural.predict)))
```

```
Setting levels: control = 0, case = 1
Setting direction: controls < cases</pre>
```

Accuracy: 0.5939, AOC: 0.5949. So the Artificial neural network model is better than the other 4 models because its accuracy and AOC is lower than the other models.

# K-th Nearest Neighbors Model

package used: class

package link: class: Functions for Classification (r-project.org) (https://cran.r-project.org/web/packages/class/class.pdf)

This model classifies through the nearest points on the graph, it groups according to the distance between the points. Nearer points will be form a group.
